Data Communications & Networks

Session 7 – Main Theme
Networks: Part I
Circuit Switching, Packet Switching, The Network Layer

Dr. Jean-Claude Franchitti

New York University
Computer Science Department
Courant Institute of Mathematical Sciences

Agenda

1. Session Overview
2. Networks Part 1
3. Summary and Conclusion
What is the class about?

- Course description and syllabus:
  - http://www.nyu.edu/classes/jcf/csci-ga.2262-001/
  - http://cs.nyu.edu/courses/Fall12/CSCI-GA.2262-001/index.html

- Textbooks:
    James F. Kurose, Keith W. Ross
    Addison Wesley
Course Overview

- Computer Networks and the Internet
- Application Layer
- Fundamental Data Structures: queues, ring buffers, finite state machines
- Data Encoding and Transmission
- Local Area Networks and Data Link Control
- Wireless Communications
- Packet Switching
- OSI and Internet Protocol Architecture
- Congestion Control and Flow Control Methods
- Internet Protocols (IP, ARP, UDP, TCP)
- Network (packet) Routing Algorithms (OSPF, Distance Vector)
- IP Multicast
- Sockets
Course Approach

- Introduction to Basic Networking Concepts (Network Stack)
- Origins of Naming, Addressing, and Routing (TCP, IP, DNS)
- Physical Communication Layer
- MAC Layer (Ethernet, Bridging)
- Routing Protocols (Link State, Distance Vector)
- Internet Routing (BGP, OSPF, Programmable Routers)
- TCP Basics (Reliable/Unreliable)
-Congestion Control
- QoS, Fair Queuing, and Queuing Theory
- Network Services – Multicast and Unicast
- Extensions to Internet Architecture (NATs, IPv6, Proxies)
- Network Hardware and Software (How to Build Networks, Routers)
- Overlay Networks and Services (How to Implement Network Services)
- Network Firewalls, Network Security, and Enterprise Networks
Networks Part 1 Session in Brief

- Understand principles behind network layer services:
  - Network layer service models
  - Forwarding versus routing
  - How a router works
- Instantiation, implementation in the Internet
- Conclusion
Agenda

1. Session Overview
2. Networks Part 1
3. Summary and Conclusion
Networks Part 1 Agenda

- Introduction
- Virtual circuit and datagram networks
- What’s inside a router
- IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
Switching Networks

- Long distance transmission is typically done over a network of switched nodes
- Nodes not concerned with content of data
- End devices are stations
  - Computer, terminal, phone, etc.
- A collection of nodes and connections is a communications network
- Data routed by being switched from node to node
Two different switching technologies

- Circuit switching
- Packet switching
Simple Switched Network
Circuit Switching

- Dedicated communication path between two stations (during conversation)
- Three phases
  - Establish
  - Transfer
  - Disconnect
- Must have switching capacity and channel capacity to establish connection
- Must have intelligence to work out routing
Circuit Switching - Issues

- Circuit switching is inefficient (designed for voice)
  - Resources dedicated to a particular call
  - Much of the time a data connection is idle
  - Data rate is fixed
    - Both ends must operate at the same rate
- Set up (connection) takes time
- Once connected, transfer is transparent
Packet Switching – Basic Operation

- Data transmitted in small packets
  - Typically 1000 octets
  - Longer messages split into series of packets
  - Each packet contains a portion of user data plus some control info

- Control info
  - Routing (addressing) info

- Packets are received, stored briefly (buffered) and passed on to the next node
  - Store and forward
Use of Packets
Network layer

- transport segment from sending to receiving host
- on sending side encapsulates segments into datagrams
- on receiving side, delivers segments to transport layer
- network layer protocols in every host, router
- router examines header fields in all IP datagrams passing through it
Two Key Network-Layer Functions

- **forwarding**: move packets from router’s input to appropriate router output

- **routing**: determine route taken by packets from source to dest.

  » **routing algorithms**

  » **analogy**:

  - **routing**: process of planning trip from source to dest

  - **forwarding**: process of getting through single interchange
Interplay between routing and forwarding

<table>
<thead>

</tbody>
</table>

Routing algorithm

Value in arriving packet's header
3rd important function in some network architectures:

- ATM, frame relay, X.25

Before datagrams flow, two end hosts and intervening routers establish virtual connection:

- Routers get involved

Network vs transport layer connection service:

- Network: between two hosts (may also involve intervening routers in case of VCs)
- Transport: between two processes
Q: What *service model* for “channel” transporting datagrams from sender to receiver?

**Example services for individual datagrams:**
- guaranteed delivery
- guaranteed delivery with less than 40 msec delay

**Example services for a flow of datagrams:**
- in-order datagram delivery
- guaranteed minimum bandwidth to flow
- restrictions on changes in inter-packet spacing
## Network layer service models

Networks Part 1 Agenda

- Introduction
- Virtual circuit and datagram networks
- What’s inside a router
- IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
Network layer connection and connection-less service

- datagram network provides network-layer connectionless service
- VC network provides network-layer connection service
- analogous to the transport-layer services, but:
  » service: host-to-host
  » no choice: network provides one or the other
  » implementation: in network core
Virtual circuits

“source-to-dest path behaves much like telephone circuit”
  » performance-wise
  » network actions along source-to-dest path

- call setup, teardown for each call before data can flow
- each packet carries VC identifier (not destination host address)
- every router on source-dest path maintains “state” for each passing connection
- link, router resources (bandwidth, buffers) may be allocated to VC (dedicated resources = predictable service)
a VC consists of:

1. path from source to destination
2. VC numbers, one number for each link along path
3. entries in forwarding tables in routers along path

- packet belonging to VC carries VC number (rather than dest address)
- VC number can be changed on each link.
  » New VC number comes from forwarding table
### Forwarding table

<table>
<thead>

<td>...</td>
</tr>
</tbody>
</table>

Routers maintain connection state information!
Virtual circuits: signaling protocols

- used to setup, maintain, and teardown VC
- used in ATM, frame-relay, X.25
- not used in today’s Internet
**Datagram networks**

- no call setup at network layer
- routers: no state about end-to-end connections
  - no network-level concept of “connection”
- packets forwarded using destination host address
  - packets between same source-dest pair may take different paths

```
1. Send data
2. Receive data
```

Examples

**DA:** 11001000 00010111 00010110 10100001  
Which interface?

**DA:** 11001000 00010111 00011000 10101010  
Which interface?
Datagram or VC network: why?

Internet (datagram)
- data exchange among computers
  - “elastic” service, no strict timing req.
- “smart” end systems (computers)
  - can adapt, perform control, error recovery
  - simple inside network, complexity at “edge”
- many link types
  - different characteristics
  - uniform service difficult

ATM (VC)
- evolved from telephony
- human conversation:
  - strict timing, reliability requirements
  - need for guaranteed service
- “dumb” end systems
  - telephones
  - complexity inside network
Networks Part 1 Agenda

- Introduction
- Virtual circuit and datagram networks
- What’s inside a router
- IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
Two key router functions:

- run routing algorithms/protocol (RIP, OSPF, BGP)
- *for* outgoing datagrams

Diagram: 
- Input ports
- Switching fabric
- Output ports
Input Port Functions

Decentralized switching:
- given datagram dest., lookup output port using forwarding table in input port memory
- goal: complete input port processing at ‘line speed’
- queuing: if datagrams arrive faster than forwarding rate into switch fabric

Physical layer: bit-level reception
Data link layer: e.g., Ethernet (see Textbook Chapter 5)
Three types of switching fabrics

- Memory
- Bus
- Crossbar
First generation routers:
- traditional computers with switching under direct control of CPU
- packet copied to system’s memory
- speed limited by memory bandwidth (2 bus crossings per datagram)
Switching Via a Bus

- datagram from input port memory to output port memory via a shared bus
- **bus contention**: switching speed limited by bus bandwidth
- 32 Gbps bus, Cisco 5600: sufficient speed for access and enterprise routers
Switching Via An Interconnection Network

- overcome bus bandwidth limitations
- Banyan networks, other interconnection nets initially developed to connect processors in multiprocessor
- advanced design: fragmenting datagram into fixed length cells, switch cells through the fabric.
- Cisco 12000: switches 60 Gbps through the interconnection network
Output Ports

- **Buffering** required when datagrams arrive from fabric faster than the transmission rate
- **Scheduling discipline** chooses among queued datagrams for transmission
Output port queueing

- buffering when arrival rate via switch exceeds output line speed
- *queueing (delay) and loss due to output port buffer overflow!*
RFC 3439 rule of thumb: average buffering equal to “typical” RTT (say 250 msec) times link capacity C
  » e.g., C = 10 Gps link: 2.5 Gbit buffer
Recent recommendation: with $N$ flows, buffering equal to
\[
\frac{\text{RTT} \times C}{\sqrt{N}}
\]
Input Port Queuing

- Fabric slower than input ports combined -> queueing may occur at input queues
- Head-of-the-Line (HOL) blocking: queued datagram at front of queue prevents others in queue from moving forward
- queueing delay and loss due to input buffer overflow!

![Diagram showing input port queuing with examples of switch fabric and packet transfer]

output port contention at time t - only one red packet can be transferred

green packet experiences HOL blocking
Networks Part 1 Agenda

- Introduction
- Virtual circuit and datagram networks
- What’s inside a router
- **IP: Internet Protocol**
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
The Internet Network layer

Host, router network layer functions:

- **Routing protocols**
  - path selection
  - RIP, OSPF, BGP

- **IP protocol**
  - addressing conventions
  - datagram format
  - packet handling conventions

- **ICMP protocol**
  - error reporting
  - router "signaling"

Transport layer: TCP, UDP

Network layer

Link layer

physical layer
Networks Part 1 Agenda

</tr>
</tbody>
</table>

**How much overhead with TCP?**
- 20 bytes of TCP
- 20 bytes of IP
- = 40 bytes + app layer overhead

**Total datagram length (bytes) for fragmentation/reassembly**

**E.g. timestamp, record route taken, specify list of routers to visit.**
IP Fragmentation & Reassembly

- network links have MTU (max.transfer size) - largest possible link-level frame.
  - different link types, different MTUs
- large IP datagram divided (“fragmented”) within net
  - one datagram becomes several datagrams
  - “reassembled” only at final destination
  - IP header bits used to identify, order related fragments

fragmentation:
in: one large datagram
out: 3 smaller datagrams

reassembly
IP Fragmentation and Reassembly

Example
- 4000 byte datagram
- MTU = 1500 bytes
  1480 bytes in data field

One large datagram becomes several smaller datagrams

Networks Part 1 Agenda

- Introduction
- Virtual circuit and datagram networks
- What’s inside a router
- IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
IP Addressing: introduction

- **IP address:** 32-bit identifier for host, router *interface*
  - ***interface:** connection between host/router and physical link
    - router’s typically have multiple interfaces
    - host typically has one interface
    - IP addresses associated with each interface

```plaintext
223.1.1.1 = 11011111 00000001 00000001 00000001
```

223 1 1 1
- **IP address:**
  - subnet part (high order bits)
  - host part (low order bits)
- **What’s a subnet?**
  - device interfaces with same subnet part of IP address
  - can physically reach each other without intervening router
Recipe

- To determine the subnets, detach each interface from its host or router, creating islands of isolated networks. Each isolated network is called a subnet.

Subnet mask: /24
Subnets

How many?
CIDR: Classless InterDomain Routing

- subnet portion of address of arbitrary length
- address format: \texttt{a.b.c.d/x}, where \( x \) is \# bits in subnet portion of address

\begin{figure}
\centering
\includegraphics[width=\textwidth]{cidr_example}
\end{figure}

\texttt{200.23.16.0/23}
Q: How does a host get IP address?

- hard-coded by system admin in a file
  - Windows: control-panel->network->configuration->tcp/ip->properties
  - UNIX: /etc/rc.config
- DHCP: Dynamic Host Configuration Protocol: dynamically get address from as server
  - “plug-and-play”
Goal: allow host to *dynamically* obtain its IP address from network server when it joins network
    Can renew its lease on address in use
    Allows reuse of addresses (only hold address while connected an “on”)
    Support for mobile users who want to join network (more shortly)

DHCP overview:
» host broadcasts “DHCP discover” msg [optional]
» DHCP server responds with “DHCP offer” msg [optional]
» host requests IP address: “DHCP request” msg
» DHCP server sends address: “DHCP ack” msg
DHCP client-server scenario

arriving DHCP client needs address in this network
DHCP client-server scenario

DHCP server: 223.1.2.5

DHCP discover
src: 0.0.0.0, 68
dest.: 255.255.255.255, 67
yiaddr: 0.0.0.0
transaction ID: 654

DHCP offer
src: 223.1.2.5, 67
dest: 255.255.255.255, 68
yiaddrr: 223.1.2.4
transaction ID: 654
Lifetime: 3600 secs

DHCP request
src: 0.0.0.0, 68
dest:: 255.255.255.255, 67
yiaddrr: 223.1.2.4
transaction ID: 655
Lifetime: 3600 secs

DHCP ACK
src: 223.1.2.5, 67
dest: 255.255.255.255, 68
yiaddrr: 223.1.2.4
transaction ID: 655
Lifetime: 3600 secs
DHCP can return more than just allocated IP address on subnet:

» address of first-hop router for client
» name and IP address of DNS sever
» network mask (indicating network versus host portion of address)
DHCP: example

- connecting laptop needs its IP address, addr of first-hop router, addr of DNS server: use DHCP
- DHCP request encapsulated in UDP, encapsulated in IP, encapsulated in 802.1 Ethernet
- Ethernet frame broadcast (dest: FFFFFFFF) on LAN, received at router running DHCP server
- Ethernet demux’ed to IP demux’ed, UDP demux’ed to DHCP
- DCP server formulates DHCP ACK containing client's IP address, IP address of first-hop router for client, name & IP address of DNS server

- encapsulation of DHCP server, frame forwarded to client, demux'ing up to DHCP at client

- client now knows its IP address, name and IP address of DNS server, IP address of its first-hop router
DHCP: wireshark output
(home LAN)

Message type: **Boot Request (1)**
Hardware type: Ethernet
Hardware address length: 6
Hops: 0

Hierarchical addressing allows efficient advertisement of routing information:

Organization 0
200.23.16.0/23

Organization 1
200.23.18.0/23

Organization 2
200.23.20.0/23

Organization 7
200.23.30.0/23

Fly-By-Night-ISP

"Send me anything with addresses beginning 200.23.16.0/20"

ISPs-R-Us

"Send me anything with addresses beginning 199.31.0.0/16"

Internet
Hierarchical addressing: more specific routes

**ISPs-R-Us** has a more specific route to **Organization 1**

- **Organization 0**
  - 200.23.16.0/23

- **Organization 2**
  - 200.23.20.0/23

- **Organization 7**
  - 200.23.30.0/23

- **Organization 1**
  - 200.23.18.0/23

**ISP**

- Fly-By-Night-ISP
  - "Send me anything with addresses beginning 200.23.16.0/20"

- **ISPs-R-Us**
  - "Send me anything with addresses beginning 199.31.0.0/16 or 200.23.18.0/23"

**Internet**
**Q:** How does an ISP get block of addresses?

**A:** ICANN: Internet Corporation for Assigned Names and Numbers
- allocates addresses
- manages DNS
- assigns domain names, resolves disputes
All datagrams leaving local network have same single source NAT IP address: 138.76.29.7, different source port numbers

Datagrams with source or destination in this network have 10.0.0/24 address for source, destination (as usual)
Motivation: local network uses just one IP address as far as outside world is concerned:

- range of addresses not needed from ISP: just one IP address for all devices
- can change addresses of devices in local network without notifying outside world
- can change ISP without changing addresses of devices in local network
- devices inside local net not explicitly addressable, visible by outside world (a security plus).
Implementation: NAT router must:

- **outgoing datagrams: replace** (source IP address, port #) of every outgoing datagram to (NAT IP address, new port #)
  
  . . . remote clients/servers will respond using (NAT IP address, new port #) as destination addr.

- **remember (in NAT translation table)** every (source IP address, port #) to (NAT IP address, new port #) translation pair

- **incoming datagrams: replace** (NAT IP address, new port #) in dest fields of every incoming datagram with corresponding (source IP address, port #) stored in NAT table
NAT: Network Address Translation

1: host 10.0.0.1 sends datagram to 128.119.40.186, 80

2: NAT router changes datagram source addr from 10.0.0.1, 3345 to 138.76.29.7, 5001, updates table

NAT translation table

<table>
<thead>
<tr>
<th>WAN side addr</th>
<th>LAN side addr</th>
</tr>
</thead>
<tbody>
<tr>
<td>138.76.29.7, 5001</td>
<td>10.0.0.1, 3345</td>
</tr>
<tr>
<td>......</td>
<td>......</td>
</tr>
</tbody>
</table>

3: Reply arrives
dest. address: 138.76.29.7, 5001

4: NAT router changes datagram dest addr from 138.76.29.7, 5001 to 10.0.0.1, 3345
NAT: Network Address Translation

- 16-bit port-number field:
  » 60,000 simultaneous connections with a single LAN-side address!

- NAT is controversial:
  » routers should only process up to layer 3
  » violates end-to-end argument
    • NAT possibility must be taken into account by app designers, eg, P2P applications
  » address shortage should instead be solved by IPv6
NAT traversal problem

- client wants to connect to server with address 10.0.0.1
  - server address 10.0.0.1 local to LAN (client can’t use it as destination addr)
  - only one externally visible NATted address: 138.76.29.7

- solution 1: statically configure NAT to forward incoming connection requests at given port to server
  - e.g., (123.76.29.7, port 2500) always forwarded to 10.0.0.1 port 25000
NAT traversal problem

- solution 2: Universal Plug and Play (UPnP) Internet Gateway Device (IGD) Protocol. Allows NATted host to:
  - learn public IP address (138.76.29.7)
  - add/remove port mappings (with lease times)

  i.e., automate static NAT port map configuration
solution 3: relaying (used in Skype)
- NATed client establishes connection to relay
- External client connects to relay
- relay bridges packets between to connections
Networks Part 1 Agenda

- Introduction
- Virtual circuit and datagram networks
- What’s inside a router
- IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
ICMP: Internet Control Message Protocol

- used by hosts & routers to communicate network-level information
  - error reporting: unreachable host, network, port, protocol
  - echo request/reply (used by ping)
- network-layer “above” IP:
  - ICMP msgs carried in IP datagrams
- **ICMP message**: type, code plus first 8 bytes of IP datagram causing error

<table>
<thead>
<tr>
<th>Type</th>
<th>Code</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>echo reply (ping)</td>
</tr>
<tr>
<td>3</td>
<td>0</td>
<td>dest. network unreachable</td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>dest host unreachable</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>dest protocol unreachable</td>
</tr>
<tr>
<td>3</td>
<td>3</td>
<td>dest port unreachable</td>
</tr>
<tr>
<td>3</td>
<td>6</td>
<td>dest network unknown</td>
</tr>
<tr>
<td>3</td>
<td>7</td>
<td>dest host unknown</td>
</tr>
<tr>
<td>4</td>
<td>0</td>
<td>source quench (congestion control - not used)</td>
</tr>
<tr>
<td>8</td>
<td>0</td>
<td>echo request (ping)</td>
</tr>
<tr>
<td>9</td>
<td>0</td>
<td>route advertisement</td>
</tr>
<tr>
<td>10</td>
<td>0</td>
<td>router discovery</td>
</tr>
<tr>
<td>11</td>
<td>0</td>
<td>TTL expired</td>
</tr>
<tr>
<td>12</td>
<td>0</td>
<td>bad IP header</td>
</tr>
</tbody>
</table>
Traceroute and ICMP

- Source sends series of UDP segments to dest
  - First has TTL = 1
  - Second has TTL = 2, etc.
  - Unlikely port number

- When nth datagram arrives to nth router:
  - Router discards datagram
  - And sends to source an ICMP message (type 11, code 0)
  - Message includes name of router& IP address

- When ICMP message arrives, source calculates RTT
- Traceroute does this 3 times

**Stopping criterion**

- UDP segment eventually arrives at destination host
- Destination returns ICMP “host unreachable” packet (type 3, code 3)
- When source gets this ICMP, stops.
Networks Part 1 Agenda

- Introduction
- Virtual circuit and datagram networks
- What’s inside a router
- IP: Internet Protocol
  - Datagram format
  - IPv4 addressing
  - ICMP
  - IPv6
IPv6

- **Initial motivation:** 32-bit address space soon to be completely allocated.
- **Additional motivation:**
  - header format helps speed processing/forwarding
  - header changes to facilitate QoS

**IPv6 datagram format:**
- fixed-length 40 byte header
- no fragmentation allowed
**Priority:** identify priority among datagrams in flow

**Flow Label:** identify datagrams in same “flow.”
(concept of “flow” not well defined).

**Next header:** identify upper layer protocol for data

<table>
<thead>
<tr>
<th></th>
<th>pri</th>
<th>flow label</th>
<th>payload len</th>
<th>next hdr</th>
<th>hop limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>ver</td>
<td></td>
<td>source address</td>
<td>(128 bits)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>destination address</td>
<td>(128 bits)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>data</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

32 bits
Other Changes from IPv4

- **Checksum**: removed entirely to reduce processing time at each hop
- **Options**: allowed, but outside of header, indicated by “Next Header” field
- **ICMPv6**: new version of ICMP
  - additional message types, e.g. “Packet Too Big”
  - multicast group management functions
Transition From IPv4 To IPv6

- Not all routers can be upgraded simultaneous
  - no “flag days”
  - How will the network operate with mixed IPv4 and IPv6 routers?
- **Tunneling:** IPv6 carried as payload in IPv4 datagram among IPv4 routers
Tunneling (1/2)

Logical view:
A IPv6 B tunnel IPv6 E IPv6 F IPv6

Physical view:
A IPv6 B IPv4 IPv4 E IPv6 F IPv6
Tunneling (2/2)

Logical view:

Physical view:
