Data Communications & Networks

Session 5 – Main Theme
Wireless and Mobile Networks

Dr. Jean-Claude Franchitti

New York University
Computer Science Department
Courant Institute of Mathematical Sciences

Adapted from course textbook resources
Computer Networking: A Top-Down Approach, 5/E

Agenda

1. Session Overview
2. Wireless and Mobile Networks
3. Summary and Conclusion
What is the class about?

- Course description and syllabus:
  - [http://www.nyu.edu/classes/jcf/g22.2262-001/](http://www.nyu.edu/classes/jcf/g22.2262-001/)

- Textbooks:
    James F. Kurose, Keith W. Ross
    Addison Wesley

Course Overview

- Computer Networks and the Internet
- Application Layer
- Fundamental Data Structures: queues, ring buffers, finite state machines
- Data Encoding and Transmission
- Local Area Networks and Data Link Control
- Wireless Communications
- Packet Switching
- OSI and Internet Protocol Architecture
- Congestion Control and Flow Control Methods
- Internet Protocols (IP, ARP, UDP, TCP)
- Network (packet) Routing Algorithms (OSPF, Distance Vector)
- IP Multicast
- Sockets
Background:
- # wireless (mobile) phone subscribers now exceeds # wired phone subscribers!
- computer nets: laptops, palmtops, PDAs, Internet-enabled phone promise anytime untethered Internet access
- two important (but different) challenges
  - wireless: communication over wireless link
  - mobility: handling the mobile user who changes point of attachment to network

Wireless and Mobile Networks Session in Brief
- Introduction
- Wireless
  - Wireless Links characteristics – CDMA
  - IEEE 802.11 wireless LANs (“wi-fi”)
  - Cellular Internet Access architecture and standards (e.g., GSM)
- Mobility
  - Principles addressing and routing to mobile users
  - Mobile IP
  - Handling mobility in cellular networks
  - Mobility and higher-layer protocols
- Summary
Session Outline

1 Introduction

Wireless
- 2 Wireless links, characteristics
  » CDMA
- 3 IEEE 802.11 wireless LANs (“wi-fi”)
- 4 Cellular Internet Access
  » architecture
  » standards (e.g., GSM)

Mobility
- 5 Principles: addressing and routing to mobile users
- 6 Mobile IP
- 7 Handling mobility in cellular networks
- 8 Mobility and higher-layer protocols

9 Summary

Elements of a wireless network

- network infrastructure
- wireless hosts
  - laptop, PDA, IP phone
  - run applications
  - may be stationary (non-mobile) or mobile
  » wireless does not always mean mobility
Elements of a wireless network

- **base station**
  - typically connected to wired network
  - relay - responsible for sending packets between wired network and wireless host(s) in its “area”
  - e.g., cell towers, 802.11 access points

- **wireless link**
  - typically used to connect mobile(s) to base station
  - also used as backbone link
  - multiple access protocol coordinates link access
  - various data rates, transmission distance
Characteristics of selected wireless link standards

- **Indoor** (10-30m)
  - 802.11a, 802.11b, 802.11g
  - IS-95, CDMA, GSM

- **Outdoor** (50-200m)
  - 802.11n
  - 802.11a,g point-to-point
  - UMTS/WCDMA-HSPDA, CDMA2000-1xEVDO

- **Mid-range outdoor** (200m – 4 Km)
  - 802.15
  - UMTS/WCDMA, CDMA2000

- **Long-range outdoor** (5Km – 20 Km)
  - 802.16 (WiMAX)
  - 802.16 (WiMAX) enhanced

Data rate (Mbps)
- 200
- 54
- 5-11
- 4
- 1
- 0.384
- 0.056

Elements of a wireless network

- **Network infrastructure**
- **Infrastructure mode**
  - base station connects mobiles into wired network
  - handoff: mobile changes base station providing connection into wired network
Elements of a wireless network

- **ad hoc mode**
  - no base stations
  - nodes can only transmit to other nodes within link coverage
  - nodes organize themselves into a network: route among themselves

Wireless network taxonomy

<table>
<thead>
<tr>
<th>Infrastructure (e.g., APs)</th>
<th>single hop</th>
<th>multiple hops</th>
</tr>
</thead>
<tbody>
<tr>
<td>infrastructure</td>
<td>host connects to base station (WiFi, WiMAX, cellular) which connects to larger Internet</td>
<td>host may have to relay through several wireless nodes to connect to larger Internet: mesh net</td>
</tr>
<tr>
<td>no infrastructure</td>
<td>no base station, no connection to larger Internet (Bluetooth, ad hoc nets)</td>
<td>no base station, no connection to larger Internet. May have to relay to reach other a given wireless node MANET, VANET</td>
</tr>
</tbody>
</table>
Wireless Link Characteristics (1)

Differences from wired link ….

» decreased signal strength: radio signal attenuates as it propagates through matter (path loss)
» interference from other sources: standardized wireless network frequencies (e.g., 2.4 GHz) shared by other devices (e.g., phone); devices (motors) interfere as well
» multipath propagation: radio signal reflects off objects ground, arriving ad destination at slightly different times

… make communication across (even a point to point) wireless link much more “difficult”

Wireless Link Characteristics (2)

- SNR: signal-to-noise ratio
  » larger SNR – easier to extract signal from noise (a “good thing”)
- SNR versus BER tradeoffs
  » given physical layer: increase power -> increase SNR- >decrease BER
  » given SNR: choose physical layer that meets BER requirement, giving highest throughput
    - SNR may change with mobility: dynamically adapt physical layer (modulation technique, rate)
Wireless network characteristics

Multiple wireless senders and receivers create additional problems (beyond multiple access):

- Hidden terminal problem
  - B, A hear each other
  - B, C hear each other
  - A, C can not hear each other
  means A, C unaware of their interference at B

- Signal attenuation:
  - B, A hear each other
  - B, C hear each other
  - A, C can not hear each other interfering at B

Code Division Multiple Access (CDMA)

- used in several wireless broadcast channels (cellular, satellite, etc) standards
- unique “code” assigned to each user; i.e., code set partitioning
- all users share same frequency, but each user has own “chipping” sequence (i.e., code) to encode data
- \[ encoded \text{ signal} = (\text{original data}) \times (\text{chipping sequence}) \]
- \[ decoding: \text{inner-product of encoded signal and chipping sequence} \]
- allows multiple users to “coexist” and transmit simultaneously with minimal interference (if codes are “orthogonal”)
CDMA Encode/Decode

\[ Z_{i,m} = d_i c_m \]

\[ D_i = \sum_{m=1}^{M} Z_{i,m} c_m \]

CDMA: two-sender interference

\[ Z_{i,m}^1 = d_i^1 c_m^1 \]

\[ D_i^1 = \sum_{m=1}^{M} Z_{i,m}^1 c_m^1 \]
Session Outline

1 Introduction

Wireless
- 2 Wireless links, characteristics
  » CDMA
- 3 IEEE 802.11 wireless LANs ("wi-fi")
- 4 cellular Internet access
  » architecture
  » standards (e.g., GSM)

Mobility
- 5 Principles: addressing and routing to mobile users
- 6 Mobile IP
- 7 Handling mobility in cellular networks
- 8 Mobility and higher-layer protocols

9 Summary

IEEE 802.11 Wireless LAN

- 802.11b
  » 2.4-5 GHz unlicensed spectrum
  » up to 11 Mbps
  » direct sequence spread spectrum (DSSS) in physical layer
    - all hosts use same chipping code

- 802.11a
  » 5-6 GHz range
  » up to 54 Mbps

- 802.11g
  » 2.4-5 GHz range
  » up to 54 Mbps

- 802.11n: multiple antennae
  » 2.4-5 GHz range
  » up to 200 Mbps

- all use CSMA/CA for multiple access
- all have base-station and ad-hoc network versions
802.11 LAN architecture

- wireless host communicates with base station
  - base station = access point (AP)
- Basic Service Set (BSS) (aka “cell”) in infrastructure mode contains:
  - wireless hosts
  - access point (AP): base station
  - ad hoc mode: hosts only

802.11: Channels, association

- 802.11b: 2.4GHz-2.485GHz spectrum divided into 11 channels at different frequencies
  - AP admin chooses frequency for AP
  - interference possible: channel can be same as that chosen by neighboring AP!
- host: must associate with an AP
  - scans channels, listening for beacon frames containing AP’s name (SSID) and MAC address
  - selects AP to associate with
  - may perform authentication [Chapter 8]
  - will typically run DHCP to get IP address in AP’s subnet
**802.11: passive/active scanning**

**Passive Scanning:**
1. Beacon frames sent from APs
2. Association Request frame sent: H1 to selected AP
3. Association Response frame sent: H1 to selected AP

**Active Scanning:**
1. Probe Request frame broadcast from H1
2. Probes response frame sent from APs
3. Association Request frame sent: H1 to selected AP
4. Association Response frame sent: H1 to selected AP

**IEEE 802.11: multiple access**

- avoid collisions: 2+ nodes transmitting at same time
- **802.11**: CSMA - sense before transmitting
  - don’t collide with ongoing transmission by other node
- **802.11**: no collision detection!
  - difficult to receive (sense collisions) when transmitting due to weak received signals (fading)
  - can’t sense all collisions in any case: hidden terminal, fading
  - goal: avoid collisions: CSMA/C(ollision)A(voidance)
IEEE 802.11 MAC Protocol: CSMA/CA

802.11 sender
1 if sense channel idle for DIFS then
   transmit entire frame (no CD)
2 if sense channel busy then
   start random backoff time
   timer counts down while channel idle
   transmit when timer expires
   if no ACK, increase random backoff interval,
   repeat 2

802.11 receiver
- if frame received OK
  return ACK after SIFS (ACK needed due to
  hidden terminal problem)

Avoiding collisions (more)

idea: allow sender to “reserve” channel rather than random
access of data frames: avoid collisions of long data frames
- sender first transmits small request-to-send (RTS) packets to BS
  using CSMA
  » RTSs may still collide with each other (but they’re short)
- BS broadcasts clear-to-send CTS in response to RTS
- CTS heard by all nodes
  » sender transmits data frame
  » other stations defer transmissions

avoid data frame collisions completely
using small reservation packets!
Collision Avoidance: RTS-CTS exchange

802.11 frame: addressing

Address 1: MAC address of wireless host or AP to receive this frame
Address 2: MAC address of wireless host or AP transmitting this frame
Address 3: MAC address of router interface to which AP is attached
Address 4: used only in ad hoc mode
802.11 frame: addressing

802.11 frame: more

- Protocol version
- Type
- Subtype
- To AP
- From AP
- More frag
- Retry
- Power mgt
- More data
- WEP
- Rsvd

frame type (RTS, CTS, ACK, data)
802.11: mobility within same subnet

- H1 remains in same IP subnet: IP address can remain same
- switch: which AP is associated with H1?
  - self-learning (Ch. 5): switch will see frame from H1 and “remember” which switch port can be used to reach H1

802.11: advanced capabilities

Rate Adaptation

- base station, mobile dynamically change transmission rate (physical layer modulation technique) as mobile moves. SNR varies

1. SNR decreases, BER increase as node moves away from base station
2. When BER becomes too high, switch to lower transmission rate but with lower BER
802.11: advanced capabilities

**Power Management**

- node-to-AP: “I am going to sleep until next beacon frame”
  - AP knows not to transmit frames to this node
  - node wakes up before next beacon frame
- beacon frame: contains list of mobiles with AP-to-mobile frames waiting to be sent
  - node will stay awake if AP-to-mobile frames to be sent; otherwise sleep again until next beacon frame

802.15: personal area network

- less than 10 m diameter
- replacement for cables (mouse, keyboard, headphones)
- ad hoc: no infrastructure
- master/slaves:
  - slaves request permission to send (to master)
  - master grants requests
- 802.15: evolved from Bluetooth specification
  - 2.4-2.5 GHz radio band
  - up to 721 kbps
802.16: WiMAX

- like 802.11 & cellular: base station model
  - transmissions to/from base station by hosts with omnidirectional antenna
  - base station-to-base station backhaul with point-to-point antenna
- unlike 802.11:
  - range ~ 6 miles (“city rather than coffee shop”)
  - ~14 Mbps

802.16: WiMAX: downlink, uplink scheduling

- transmission frame
  - down-link subframe: base station to node
  - uplink subframe: node to base station

- WiMAX standard provide mechanism for scheduling, but not scheduling algorithm
Session Outline

1 Introduction

Wireless
- 2 Wireless links, characteristics
  » CDMA
- 3 IEEE 802.11 wireless LANs ("wi-fi")
- 4 Cellular Internet Access
  » architecture
  » standards (e.g., GSM)

Mobility
- 5 Principles: addressing and routing to mobile users
- 6 Mobile IP
- 7 Handling mobility in cellular networks
- 8 Mobility and higher-layer protocols

9 Summary

Components of cellular network architecture

- **MSC**
  - connects cells to wide area net
  - manages call setup (more later!)
  - handles mobility (more later!)

- **cell**
  - covers geographical region
  - **base station** (BS) analogous to 802.11 AP
  - **mobile users** attach to network through BS
  - **air-interface:** physical and link layer protocol between mobile and BS

- **Mobile Switching Center**
  - connects to public telephone network, and Internet

- **wired network**
Cellular networks: the first hop

Two techniques for sharing mobile-to-BS radio spectrum

- **combined FDMA/TDMA:** divide spectrum in frequency channels, divide each channel into time slots
- **CDMA:** code division multiple access

Cellular standards: brief survey

2G systems: voice channels

- **IS-136 TDMA:** combined FDMA/TDMA (north america)
- **GSM (global system for mobile communications):** combined FDMA/TDMA
  > most widely deployed
- **IS-95 CDMA:** code division multiple access

Don’t drown in a bowl of alphabet soup: use this for reference only
### Cellular standards: brief survey

#### 2.5 G systems: voice and data channels
- for those who can’t wait for 3G service: 2G extensions
- general packet radio service (GPRS)
  - evolved from GSM
  - data sent on multiple channels (if available)
- enhanced data rates for global evolution (EDGE)
  - also evolved from GSM, using enhanced modulation
  - data rates up to 384K
- CDMA-2000 (phase 1)
  - data rates up to 144K
  - evolved from IS-95

#### 3G systems: voice/data
- Universal Mobile Telecommunications Service (UMTS)
- CDMA-2000: CDMA in TDMA slots
  - data service: 1xEvolution Data Optimized (1xEVDO) up to 14 Mbps

….. more (and more interesting) cellular topics due to mobility (stay tuned for details)
2G (voice) network architecture

2.5G (voice+data) network architecture

Key insight: new cellular data network operates in parallel (except at edge) with existing cellular voice network

- voice network unchanged in core
- data network operates in parallel
Session Outline

1 Introduction

Wireless
- 2 Wireless links, characteristics
  » CDMA
- 3 IEEE 802.11 wireless LANs (“wi-fi”)
- 4 Cellular Internet Access
  » architecture
  » standards (e.g., GSM)

Mobility
- 5 Principles: addressing and routing to mobile users
- 6 Mobile IP
- 7 Handling mobility in cellular networks
- 8 Mobility and higher-layer protocols

9 Summary

What is mobility?

- spectrum of mobility, from the network perspective:

  no mobility
  mobile wireless user, using same access point
  mobile user, connecting/disconnecting from network using DHCP.
  mobile user, passing through multiple access point while maintaining ongoing connections (like cell phone)

  high mobility
**Mobility: Vocabulary**

- **home network**: permanent "home" of mobile (e.g., 128.119.40/24)
- **home agent**: entity that will perform mobility functions on behalf of mobile, when mobile is remote
- **Permanent address**: address in home network, can always be used to reach mobile (e.g., 128.119.40.186)

**Mobility: more vocabulary**

- **Permanent address**: remains constant (e.g., 128.119.40.186)
- **visited network**: network in which mobile currently resides (e.g., 79.129.13/24)
- **Care-of-address**: address in visited network, (e.g., 79.129.13.2)
- **foreign agent**: entity in visited network that performs mobility functions on behalf of mobile.
- **correspondent**: wants to communicate with mobile
How do you contact a mobile friend:

Consider friend frequently changing addresses, how do you find her?

- search all phone books?
- call her parents?
- expect her to let you know where he/she is?

I wonder where Alice moved to?

Mobility: approaches

- Let routing handle it: routers advertise permanent address of mobile-nodes-in-residence via usual routing table exchange.
  - routing tables indicate where each mobile located
  - no changes to end-systems
- Let end-systems handle it:
  - indirect routing: communication from correspondent to mobile goes through home agent, then forwarded to remote
  - direct routing: correspondent gets foreign address of mobile, sends directly to mobile
Mobility: approaches

- *Let routing handle it*: routers advertise permanent address of mobile-nodes-in-residence via usual routing table exchange.
  - routing tables indicate where each mobile located
  - no changes to end-systems

- *let end-systems handle it*:
  - *indirect routing*: communication from correspondent to mobile goes through home agent, then forwarded to remote
  - *direct routing*: correspondent gets foreign address of mobile, sends directly to mobile

Mobility: registration

End result:
- Foreign agent knows about mobile
- Home agent knows location of mobile
Mobility via Indirect Routing

1. Home agent intercepts packets, forwards to foreign agent.
2. Foreign agent receives packets, forwards to mobile.
3. Mobile replies directly to correspondent.
4. Correspondent addresses packets using home address of mobile.

Indirect Routing: comments

- Mobile uses two addresses:
  - permanent address: used by correspondent (hence mobile location is transparent to correspondent)
  - care-of-address: used by home agent to forward datagrams to mobile
- Foreign agent functions may be done by mobile itself
- Triangle routing: correspondent-home-network-mobile
  - inefficient when correspondent, mobile are in same network
Indirect Routing: moving between networks

- suppose mobile user moves to another network
  » registers with new foreign agent
  » new foreign agent registers with home agent
  » home agent update care-of-address for mobile
  » packets continue to be forwarded to mobile (but with new care-of-address)

- mobility, changing foreign networks transparent: *on going connections can be maintained!*

Mobility via Direct Routing

1. correspondent requests, receives foreign address of mobile
2. correspondent forwards to foreign agent
3. foreign agent receives packets, forwards to mobile
4. mobile replies directly to correspondent
Mobility via Direct Routing: comments

- overcome triangle routing problem
- non-transparent to correspondent: correspondent must get care-of-address from home agent
  » what if mobile changes visited network?

Accommodating mobility with direct routing

- anchor foreign agent: FA in first visited network
- data always routed first to anchor FA
- when mobile moves: new FA arranges to have data forwarded from old FA (chaining)
Session Outline

1 Introduction

Wireless
- 2 Wireless links, characteristics
  » CDMA
- 3 IEEE 802.11 wireless LANs ("wi-fi")
- 4 Cellular Internet Access
  » architecture
  » standards (e.g., GSM)

Mobility
- 5 Principles: addressing and routing to mobile users
- 6 Mobile IP
- 7 Handling mobility in cellular networks
- 8 Mobility and higher-layer protocols

9 Summary

Mobile IP

- RFC 3344
- has many features we’ve seen:
  » home agents, foreign agents, foreign-agent registration, care-of-addresses, encapsulation (packet-within-a-packet)
- three components to standard:
  » indirect routing of datagrams
  » agent discovery
  » registration with home agent
Mobile IP: indirect routing

- Packet sent by home agent to foreign agent: a packet within a packet
- Permanent address: 128.119.40.186
- Care-of address: 79.129.13.2
- Packet sent by correspondent
- Dest: 128.119.40.186
- Packet sent by correspondent
- Dest: 128.119.40.186
- Foreign-agent-to-mobile packet
- Dest: 128.119.40.186
- Dest: 79.129.13.2

Mobile IP: agent discovery

- **agent advertisement**: foreign/home agents advertise service by broadcasting ICMP messages (type 9)
- H,F bits: home and/or foreign agent
- R bit: registration required
- 0 or more care-of-addresses
Mobile IP: registration example

Components of cellular network architecture

recall:

different cellular networks, operated by different providers
Handling mobility in cellular networks

- **home network**: network of cellular provider you subscribe to (e.g., Sprint PCS, Verizon)
  - home location register (HLR): database in home network containing permanent cell phone #, profile information (services, preferences, billing), information about current location (could be in another network)
- **visited network**: network in which mobile currently resides
  - visitor location register (VLR): database with entry for each user currently in network
  - could be home network

**GSM: indirect routing to mobile**

1. Call routed to home network
2. Home MSC consults HLR, gets roaming number of mobile in visited network
3. Home MSC sets up 2nd leg of call to MSC in visited network
4. MSC in visited network completes call through base station to mobile
GSM: handoff with common MSC

- Handoff goal: route call via new base station (without interruption)
- reasons for handoff:
  » stronger signal to/from new BSS (continuing connectivity, less battery drain)
  » load balance: free up channel in current BSS
  » GSM doesn’t mandate why to perform handoff (policy), only how (mechanism)
- handoff initiated by old BSS

1. old BSS informs MSC of impending handoff, provides list of 1+ new BSSs
2. MSC sets up path (allocates resources) to new BSS
3. new BSS allocates radio channel for use by mobile
4. new BSS signals MSC, old BSS: ready
5. old BSS tells mobile: perform handoff to new BSS
6. mobile, new BSS signal to activate new channel
7. mobile signals via new BSS to MSC: handoff complete. MSC reroutes call
8. MSC-old-BSS resources released
- **anchor MSC**: first MSC visited during call
  - call remains routed through anchor MSC
- new MSCs add on to end of MSC chain as mobile moves to new MSC
- IS-41 allows optional path minimization step to shorten multi-MSC chain

(a) before handoff

(b) after handoff
Mobility: GSM versus Mobile IP

<table>
<thead>
<tr>
<th>GSM element</th>
<th>Comment on GSM element</th>
<th>Mobile IP element</th>
</tr>
</thead>
<tbody>
<tr>
<td>Home system</td>
<td>Network to which mobile user’s permanent phone number belongs</td>
<td>Home network</td>
</tr>
<tr>
<td>Gateway Mobile Switching Center, or “home MSC”. Home Location Register (HLR)</td>
<td>Home MSC: point of contact to obtain routable address of mobile user. HLR: database in home system containing permanent phone number, profile information, current location of mobile user, subscription information</td>
<td>Home agent</td>
</tr>
<tr>
<td>Visited System</td>

<td>Routable address for telephone call segment between home MSC and visited MSC, visible to neither the mobile nor the correspondent.</td>
<td>Care-of-address</td>
</tr>
</tbody>
</table>

Wireless, mobility: impact on higher layer protocols

- logically, impact *should* be minimal …
  - best effort service model remains unchanged
  - TCP and UDP can (and do) run over wireless, mobile
- … but performance-wise:
  - packet loss/delay due to bit-errors (discarded packets, delays for link-layer retransmissions), and handoff
  - TCP interprets loss as congestion, will decrease congestion window un-necessarily
  - delay impairments for real-time traffic
  - limited bandwidth of wireless links
Summary

Wireless
- wireless links:
  » capacity, distance
  » channel impairments
  » CDMA
- IEEE 802.11 (“wi-fi”)
  » CSMA/CA reflects wireless channel characteristics
- cellular access
  » architecture
  » standards (e.g., GSM, CDMA-2000, UMTS)

Mobility
- principles: addressing, routing to mobile users
  » home, visited networks
  » direct, indirect routing
  » care-of-addresses
- case studies
  » mobile IP
  » mobility in GSM
- impact on higher-layer protocols
Assignments & Readings

- Readings
  - Chapter 6
- Assignment #4

Programming Assignment #1

- In a programming language of your choice, implement at least two of the following applications:
  - Multi-Threaded Web Server
  - Mail User Agent with or without GUI
  - UDP pinger

Next Session: Reliable Data Transfer
